## Introduction

This document provides an overview of the MC68HC908QY4, MC68HC908QT4, MC68HC908QY2, MC68HC908QT2, MC68HC908QY1, and MC68HC908QT1 devices. For complete details refer to the *MC68HC908QY4 Data Sheet* (Motorola document order number MC68HC908QY4/D).

## General Description

The MC68HC908QY4 is a member of the low-cost, high-performance M68HC08 Family of 8-bit microcontroller units (MCUs). The M68HC08 Family is a Complex Instruction Set Computer (CISC) with a Von Neumann architecture. All MCUs in the family use the enhanced M68HC08 central processor unit (CPU08) and are available with a variety of modules, memory sizes and types, and package types.

**Table 1. MC Order Numbers**

MC Order Number	ADC	FLASH Memory	Package
MC68HC908QY1	—	1536 bytes	16-pins PDIP, SOIC, and TSSOP
MC68HC908QY2	Yes	1536 bytes	
MC68HC908QY4	Yes	4096 bytes	
MC68HC908QT1	—	1536 bytes	8-pins PDIP, SOIC, and DFN
MC68HC908QT2	Yes	1536 bytes	
MC68HC908QT4	Yes	4096 bytes	

Temperature and package designators:

C = -40°C to +85°C

V = -40°C to +105°C (available for V<sub>DD</sub> = 5 V only)

M = -40°C to +125°C (available for V<sub>DD</sub> = 5 V only)

P = Plastic dual in-line package (PDIP)

DW = Small outline integrated circuit package (SOIC)

DT = Thin shrink small outline package (TSSOP)

FQ = Dual flat no lead (DFN)

This product incorporates SuperFlash® technology licensed from SST.

---

## Features

Features include:

- High-performance M68HC08 CPU core
- Fully upward-compatible object code with M68HC05 Family
- 5-V and 3-V operating voltages ( $V_{DD}$ )
- 8-MHz internal bus operation at 5 V, 4-MHz at 3 V
- Trimmable internal oscillator
  - 3.2 MHz internal bus operation
  - 8-bit trim capability,  $\pm 5\%$  trimmed
- Auto wakeup from STOP capability
- Configuration (CONFIG) register for MCU configuration options, including low-voltage inhibit (LVI) trip point
- In-system FLASH programming
- FLASH security<sup>(1)</sup>
- On-chip in-application programmable FLASH memory (with internal program/erase voltage generation)
  - MC68HC908QY4 and MC68HC908QT4 — 4096 bytes
  - MC68HC908QY2, MC68HC908QY1, MC68HC908QT2, and MC68HC908QT1 — 1536 bytes
- 128 bytes of on-chip random-access memory (RAM)
- 2-channel, 16-bit timer interface module (TIM)
- 4-channel, 8-bit analog-to-digital converter (ADC) on MC68HC908QY2, MC68HC908QY4, MC68HC908QT2, and MC68HC908QT4
- 5 or 13 bidirectional input/output (I/O) lines and one input only:
  - High current sink/source capability on all port pins
  - Selectable pullups on all ports, selectable on an individual bit basis
- 6-bit keyboard interrupt with wakeup feature (KBI)
- Low-voltage inhibit (LVI) module features software selectable trip point in CONFIG register

---

1. No security feature is absolutely secure. However, Motorola's strategy is to make reading or copying the FLASH difficult for unauthorized users.

- System protection features:
  - Computer operating properly (COP) watchdog
  - Low-voltage detection with reset
  - Illegal opcode detection with reset
  - Illegal address detection with reset
- External asynchronous interrupt pin with internal pullup ( $\overline{\text{IRQ}}$ ) shared with general-purpose input pin
- Master asynchronous reset pin ( $\overline{\text{RST}}$ ) shared with general-purpose I/O pin
- Power-on reset
- Internal pullups on  $\overline{\text{IRQ}}$  and  $\overline{\text{RST}}$  to reduce external components
- Memory mapped I/O registers
- Power saving stop and wait modes
- MC68HC908QY4, MC68HC908QY2, and MC68HC908QY1 are available in these packages:
  - 16-pin plastic dual in-line package (PDIP)
  - 16-pin small outline integrated circuit (SOIC) package
  - 16-pin thin shrink small outline package (TSSOP)
- MC68HC908QT4, MC68HC908QT2, and MC68HC908QT1 are available in these packages:
  - 8-pin PDIP
  - 8-pin SOIC
  - 8-pin dual flat no lead (DFN)

---

## MCU Block Diagram

See [Figure 1](#).

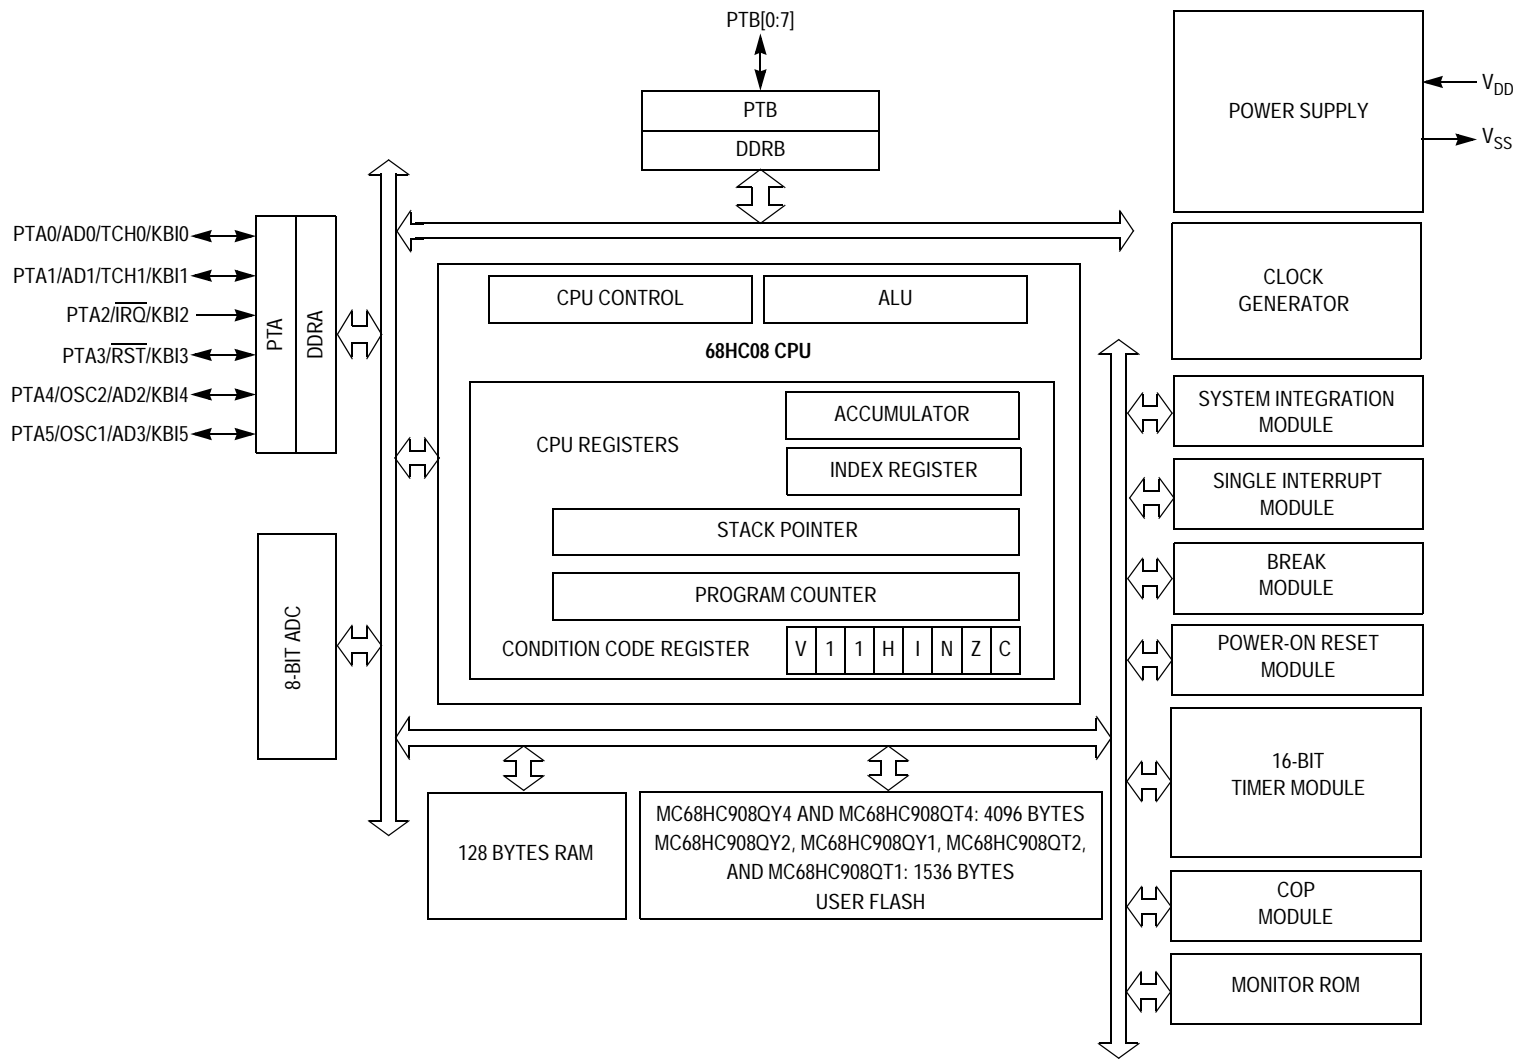

---

## Memory

The central processor unit (CPU08) can address 64 Kbytes of memory space. The memory map is shown in [Figure 3](#).

Addresses \$0000–\$003F, shown in [Figure 4](#), contain most of the control, status, and data registers.

The vector addresses are shown in [Table 3](#).

$\overline{RST}$ ,  $\overline{IRQ}$ : Pins have internal (about 30K Ohms) pull up  
PTA[0:5]: High current sink and source capability  
PTA[0:5]: Pins have programmable keyboard interrupt and pull up  
PTB[0:7]: Not available on 8-pin devices – MC68HC908QT1, MC68HC908QT2, and MC68HC908QT4

Figure 1. Block Diagram

## Pin Assignments

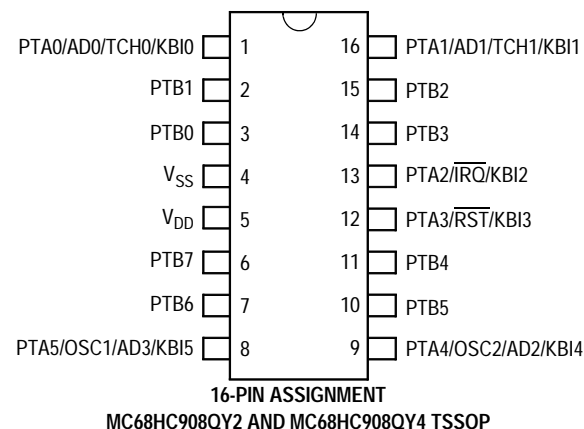

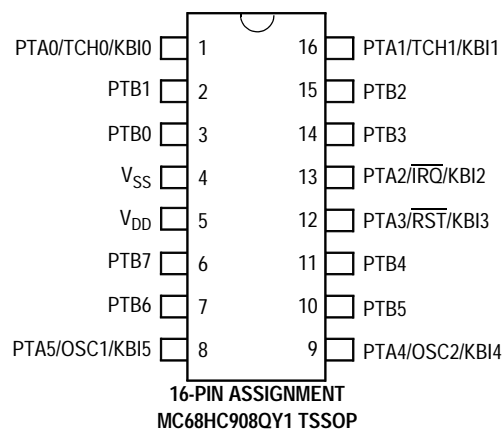

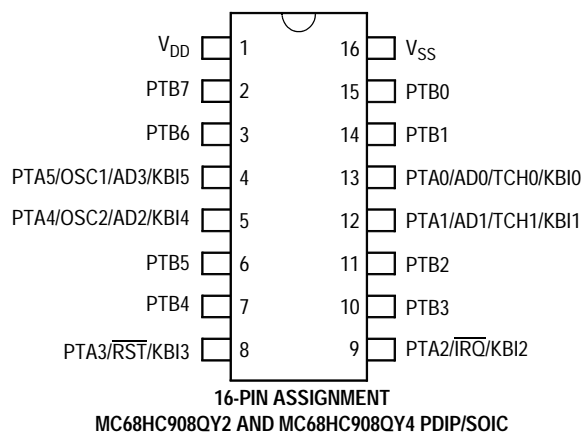

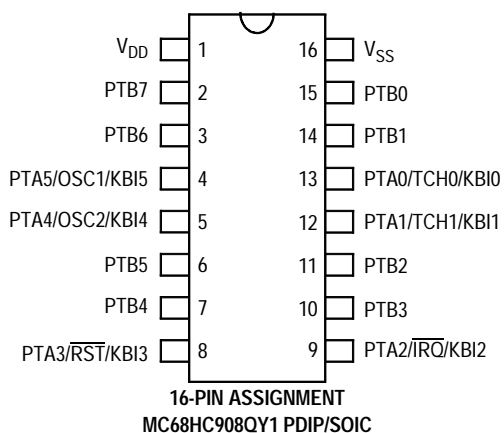

Figure 2. MCU Pin Assignments

## Pin Functions

**Table 2** provides a description of the pin functions.

**Table 2. Pin Functions**

Pin Name	Description	Input/Output
V <sub>DD</sub>	Power supply	Power
V <sub>SS</sub>	Power supply ground	Power
PTA0	PTA0 — General purpose I/O port	Input/Output
	AD0 — A/D channel 0 input	Input
	TCH0 — Timer Channel 0 I/O	Input/Output
	KBI0 — Keyboard interrupt input 0	Input
PTA1	PTA1 — General purpose I/O port	Input/Output
	AD1 — A/D channel 1 input	Input
	TCH1 — Timer Channel 1 I/O	Input/Output
	KBI1 — Keyboard interrupt input 1	Input
PTA2	PTA2 — General purpose input-only port	Input
	$\overline{\text{IRQ}}$ — External interrupt with programmable pullup and Schmitt trigger input	Input
	KBI2 — Keyboard interrupt input 2	Input
PTA3	PTA3 — General purpose I/O port	Input/Output
	$\overline{\text{RST}}$ — Reset input, active low with internal pullup and Schmitt trigger	Input
	KBI3 — Keyboard interrupt input 3	Input
PTA4	PTA4 — General purpose I/O port	Input/Output
	OSC2 — XTAL oscillator output (XTAL option only) RC or internal oscillator output (OSC2EN = 1 in PTAPUE register)	Output Output
	AD2 — A/D channel 2 input	Input
	KBI4 — Keyboard interrupt input 4	Input
PTA5	PTA5 — General purpose I/O port	Input/Output
	OSC1 — XTAL, RC, or external oscillator input	Input
	AD3 — A/D channel 3 input	Input
	KBI5 — Keyboard interrupt input 5	Input
PTB[0:7] <sup>(1)</sup>	8 general-purpose I/O ports.	Input/Output

1. The PTB pins are not available on the 8-pin packages.

	IF13 through IF6	—	Not used
	IF5	\$FFF2	TIM overflow vector (high)
		\$FFF3	TIM overflow vector (low)
	IF4	\$FFF4	TIM Channel 1 vector (high)
		\$FFF5	TIM Channel 1 vector (low)
	IF3	\$FFF6	TIM Channel 0 vector (high)
		\$FFF7	TIM Channel 0 vector (low)
	IF2	—	Not used
	IF1	\$FFFA	$\overline{\text{IRQ}}$ vector (high)
		\$FFFFB	$\overline{\text{IRQ}}$ vector (low)
	—	\$FFFC	SWI vector (high)
		\$FFFD	SWI vector (low)
	—	\$FFFE	Reset vector (high)
		\$FFFF	Reset vector (low)

## FLASH Module

The FLASH memory consists of an array of 4096 or 1536 bytes with an additional 80 bytes for user vectors and miscellaneous. The minimum size of FLASH memory that can be erased is 64 bytes; and the maximum size of FLASH memory that can be programmed in a program cycle is 32 bytes (a row). Program and erase operations are facilitated through control bits in the FLASH control register (FLCR). Details for these operations appear later in this section. The address ranges for the user memory and vectors are:

- \$EE00–\$FDFF; user memory, 4096 bytes: MC68HC908QY4 and MC68HC908QT4
- \$F800–\$FDFF; user memory, 1536 bytes: MC68HC908QY2, MC68HC908QT2, MC68HC908QY1 and MC68HC908QT1
- \$FFB0–\$FFFF; user interrupt vectors etc., 80 bytes.

**NOTE:** An erased bit reads as logic 1 and a programmed bit reads as logic 0.  
A security feature prevents unauthorized viewing of the FLASH contents.

### FLASH Control Register

The FLASH control register (FLCR) controls FLASH program and erase operations.

\$FE08	Bit 7	6	5	4	3	2	1	Bit 0
	0	0	0	0	HVEN	MASS	ERASE	PGM
Reset:	0	0	0	0	0	0	0	0

**Figure 5. FLASH Control Register (FLCR)**

HVEN — High Voltage Enable Bit

1 = High voltage enabled to array and charge pump on

MASS — Mass Erase Control Bit

1 = Mass Erase operation selected

ERASE — Erase Control Bit

1 = Erase operation selected

PGM — Program Control Bit

1 = Program operation selected

### FLASH Page Erase Operation

Use the following procedure to erase a page of FLASH memory. A page consists of 64 consecutive bytes starting from addresses \$XX00, \$XX40, \$XX80, or \$XXC0. The 80-byte user interrupt vectors area includes two pages (\$FFB0–\$FFBF and \$FFC0–\$FFFF). Any FLASH memory page can be erased alone.

1. Set the ERASE bit and clear the MASS bit in the FLASH control register.
2. Read the FLASH block protect register (\$FFBE).

3. Write any data to any FLASH location within the address range of the block to be erased.
4. Wait for a time,  $t_{nvs}$  (minimum 10  $\mu$ s).
5. Set the HVEN bit.
6. Wait for a time,  $t_{Erase}$  (minimum 1 ms or 4 ms).
7. Clear the ERASE and MASS bits.
8. Wait for a time,  $t_{nvh}$  (minimum 5  $\mu$ s).
9. Clear the HVEN bit.
10. After time,  $t_{rcv}$  (typical 1  $\mu$ s), the memory can be accessed in read mode again.

**NOTE:** *Programming and erasing of FLASH locations cannot be performed by code being executed from the FLASH memory. These operations must be performed in the order as shown, but other unrelated operations may occur between the steps.*

In applications that need up to 10,000 program/erase cycles, use the 4 ms page erase specification to get improved long-term reliability. Any application can use this 4 ms page erase specification. However, in applications where a FLASH location will be erased and reprogrammed less than 1000 times, and speed is important, use the 1 ms page erase specification to get a lower minimum erase time.

## FLASH Program Operation

Programming of the FLASH memory is done on a row basis. A row consists of 32 consecutive bytes starting from addresses \$XX00, \$XX20, \$XX40, \$XX60, \$XX80, \$XXA0, \$XXC0, or \$XXE0. Use the following step-by-step procedure to program a row of FLASH memory.

**NOTE:** *Only bytes which are currently \$FF may be programmed.*

1. Set the PGM bit. This configures the memory for program operation and enables the latching of address and data for programming.
2. Read from the FLASH block protect register (\$FFBE).
3. Write any data to any FLASH location within the address range desired.
4. Wait for a time,  $t_{nvs}$  (minimum 10  $\mu$ s).
5. Set the HVEN bit.
6. Wait for a time,  $t_{pgs}$  (minimum 5  $\mu$ s).
7. Write data to the FLASH address being programmed<sup>(1)</sup>.
8. Wait for time,  $t_{PROG}$  (minimum 30  $\mu$ s).
9. Repeat step 6 and 7 until desired bytes within the row are programmed.
10. Clear the PGM bit<sup>(1)</sup>.

---

1. The time between each FLASH address change, or the time between the last FLASH address programmed to clearing PGM bit, must not exceed the maximum programming time,  $t_{PROG}$  maximum.

11. Wait for time,  $t_{nvh}$  (minimum 5  $\mu$ s).
12. Clear the HVEN bit.
13. After time,  $t_{rcv}$  (typical 1  $\mu$ s), the memory can be accessed in read mode again.

**NOTE:** Programming and erasing of FLASH locations cannot be performed by code being executed from the FLASH memory. These operations must be performed in the order shown, other unrelated operations may occur between the steps. Do not exceed  $t_{PROG}$  maximum.

### FLASH Block Protect Register

The FLASH block protect register is implemented as a byte within the FLASH memory, and therefore it is programmed using a FLASH memory byte-programming operation. The value in this register determines the starting address of the protected range within the FLASH memory. The FLASH is protected from this address to the end of FLASH memory at \$FFFF.

**Figure 6. FLASH Block Protect Register (FLBPR)**

BPR[7:0] — FLASH Protection Register Bits [7:0]

**Figure 7. FLASH Block Protect Start Address**

**Table 4. Examples of Protect Start Address**

BPR[7:0]	Start of Address of Protect Range
\$00–\$B8	The entire FLASH memory is protected.
\$B9 (1011 1001)	\$EE40 (1110 1110 0100 0000)
\$BA (1011 1010)	\$EE80 (1110 1110 1000 0000)
\$BB (1011 1011)	\$EEC0 (1110 1110 1100 0000)
\$BC (1011 1100)	\$EF00 (1110 1111 0000 0000)
and so on...	
\$DE (1101 1110)	\$F780 (1111 0111 1000 0000)
\$DF (1101 1111)	\$F7C0 (1111 0111 1100 0000)
\$FE (1111 1110)	\$FF80 (1111 1111 1000 0000) FLBPR, OSCTRIM, and vectors are protected
\$FF	The entire FLASH memory is not protected.

## Configuration Registers (CONFIG1, CONFIG2)

The configuration registers are used to initialize various options. The configuration registers can each be written once after each reset. Most of the configuration register bits are cleared during reset. Since the various options affect the operation of the microcontroller unit (MCU) it is recommended that these registers be written immediately after reset. The configuration registers are located at \$001E and \$001F, and may be read at anytime.

\$001E	Bit 7	6	5	4	3	2	1	Bit 0
	IRQPUD	IRQEN	R	OSCOPT1	OSCOPT0	R	R	RSTEN
Reset:	0	0	0	0	0	0	0	U
POR:	0	0	0	0	0	0	0	0
	R = Reserved			U = Unaffected				

**Figure 8 Configuration Register 2 (CONFIG2)**

IRQPUD —  $\overline{\text{IRQ}}$  Pin Pullup Disable Control Bit

0 = Internal pullup is connected between  $\overline{\text{IRQ}}$  pin and  $V_{DD}$  (if IRQEN = 1)

IRQEN —  $\overline{\text{IRQ}}$  Pin Function Selection Bit

1 = PTA2/ $\overline{\text{IRQ}}$ /KBI2 pin configured for  $\overline{\text{IRQ}}$  function

0 = Pin configured for PTA2 or KBI2 function

OSCOPT1:OSCOPT0 — Selection Bits for Oscillator Option

(0:0) Internal oscillator

(0:1) External oscillator

(1:0) External RC oscillator

(1:1) External XTAL oscillator

RSTEN —  $\overline{\text{RST}}$  Pin Function Selection

1 = PTA2/ $\overline{\text{RST}}$ /KBI3 pin configured for  $\overline{\text{RESET}}$  function

0 = Pin configured for PTA3 or KBI3 function

**NOTE:** The RSTEN bit is cleared by a power-on reset (POR) only. Other resets will leave this bit unaffected.

\$001F	Bit 7	6	5	4	3	2	1	Bit 0
	COPRS	LVISTOP	LVIRSTD	LVIPWRD	LVI5OR3	SSREC	STOP	COPD
Reset:	0	0	0	0	U	0	0	0
POR:	0	0	0	0	0	0	0	0
	U = Unaffected							

**Figure 9 Configuration Register 1 (CONFIG1)**

COPRS (Out of STOP Mode) — COP Reset Period Selection Bit

1 = COP reset short cycle =  $(2^{13} - 2^4) \times \text{BUSCLKX4}$

0 = COP reset long cycle =  $(2^{18} - 2^4) \times \text{BUSCLKX4}$

To prevent a reset due to a COP watchdog timeout, write any value to COPCTL (\$FFFF) before the COP timer reaches the selected timeout.

COPRS (In STOP Mode) — Auto Wakeup Period Selection Bit

1 = Auto wakeup short cycle = approximately 16 ms

0 = Auto wakeup long cycle = approximately 650 ms

LVISTOP — LVI Enable in Stop Mode Bit

1 = LVI enabled during stop mode

0 = LVI disabled during stop mode

LVIRSTD — LVI Reset Disable Bit

1 = LVI module resets disabled

0 = LVI module resets enabled

LVIPWRD — LVI Power Disable Bit

1 = LVI module power disabled

LV15OR3 — LVI 5-V or 3-V Operating Mode Bit

1 = LVI operates in 5-V mode

0 = LVI operates in 3-V mode

**NOTE:** The LV15OR3 bit is cleared by a power-on reset (POR) only. Other resets will leave this bit unaffected.

SSREC — Short Stop Recovery Bit

1 = Stop mode recovery after 32 BUSCLKX4 cycles

0 = Stop mode recovery after 4096 BUSCLKX4 cycles

**NOTE:** Exiting stop mode by an LVI reset will result in the long stop recovery.

STOP — STOP Instruction Enable Bit

1 = STOP instruction enabled

0 = STOP instruction treated as illegal opcode

COPD — COP Disable Bit

1 = COP module disabled (does not force resets)

## LVI Status Register

The LVI status register (LVISR) indicates if the  $V_{DD}$  voltage was detected below the  $V_{TRIPF}$  level while LVI resets have been disabled.

\$FE0C	Bit 7	6	5	4	3	2	1	Bit 0
	LVIOUT	0	0	0	0	0	0	R
Reset:	0	0	0	0	0	0	0	0
	R	= Reserved						

**Figure 10. LVI Status Register (LVISR)**

LVIOUT — LVI Output Bit

This read-only flag becomes set when the  $V_{DD}$  voltage falls below the  $V_{TRIPF}$  trip voltage and is cleared when  $V_{DD}$  voltage rises above  $V_{TRIPR}$ .

## IRQ Status and Control Register

\$001D	Bit 7	6	5	4	3	2	1	Bit 0
	0	0	0	0	IRQF1	ACK1	IMASK1	MODE1
Reset:	0	0	0	0	0	0	0	0

**Figure 11. IRQ Status and Control Register (INTSCR)**

### IRQF1 — IRQ Flag

This read-only status bit is high when the IRQ interrupt is pending.  
1 =  $\overline{\text{IRQ}}$  interrupt pending

### ACK1 — IRQ Interrupt Request Acknowledge Bit

Writing a logic 1 to this write-only bit clears the IRQ latch. ACK1 always reads as logic 0.

### IMASK1 — IRQ Interrupt Mask Bit

1 = IRQ interrupt requests disabled

### MODE1 — IRQ Edge/Level Select Bit

This read/write bit controls the triggering sensitivity of the  $\overline{\text{IRQ}}$  pin.  
1 =  $\overline{\text{IRQ}}$  interrupt requests on falling edges and low levels  
0 =  $\overline{\text{IRQ}}$  interrupt requests on falling edges only

## SIM Reset Status Register

This register contains seven flags that show the source of the last reset. Clear the SIM reset status register by reading it. A power-on reset sets the POR bit and clears all other bits in the register.

\$FE01	Bit 7	6	5	4	3	2	1	Bit 0
	POR	PIN	COP	ILOP	ILAD	MODRST	LVI	0
POR:	1	0	0	0	0	0	0	0

**Figure 12. SIM Reset Status Register (SRSR)**

### POR — Power-On Reset Bit

1 = Last reset caused by POR circuit

### PIN — External Reset Bit

1 = Last reset caused by external reset pin ( $\overline{\text{RST}}$ )

### COP — Computer Operating Properly Reset Bit

1 = Last reset caused by COP timeout

### ILOP — Illegal Opcode Reset Bit

1 = Last reset caused by an illegal opcode

ILAD — Illegal Address Reset Bit (illegal attempt to fetch an opcode from an unimplemented address)

1 = Last reset caused by an opcode fetch from an illegal address

MODRST — Monitor Mode Entry Module Reset Bit

1 = Last reset caused by monitor mode entry when vector locations \$FFFE and \$FFFF are \$FF after POR while  $\overline{PTA2}/\overline{IRQ} = V_{DD}$

LVI — Low Voltage Inhibit Reset Bit

1 = Last reset caused by LVI circuit

## Interrupt Status Registers (INT1, INT2, INT3)

These three registers include status flags which indicate which interrupt sources currently have pending requests. See [Table 3](#).

\$FE04	Bit 7	6	5	4	3	2	1	Bit 0
	0	IF5	IF4	IF3	0	IF1	0	0
Reset:	0	0	0	0	0	0	0	0
Source:		TOF	TCH1	TCH0		$\overline{IRQ}$		

**Figure 13. Interrupt Status Register 1 (INT1)**

\$FE05	Bit 7	6	5	4	3	2	1	Bit 0
	IF14	0	0	0	0	0	0	0
Reset:	0	0	0	0	0	0	0	0
Source:	KBI							

**Figure 14. Interrupt Status Register 2 (INT2)**

\$FE06	Bit 7	6	5	4	3	2	1	Bit 0
	0	0	0	0	0	0	0	IF15
Reset:	0	0	0	0	0	0	0	0
Source:								ADC

**Figure 15. Interrupt Status Register 3 (INT3)**

IFxx — Interrupt Flags

These flags indicate the presence of interrupt requests from the sources shown below the corresponding IFxx bit.

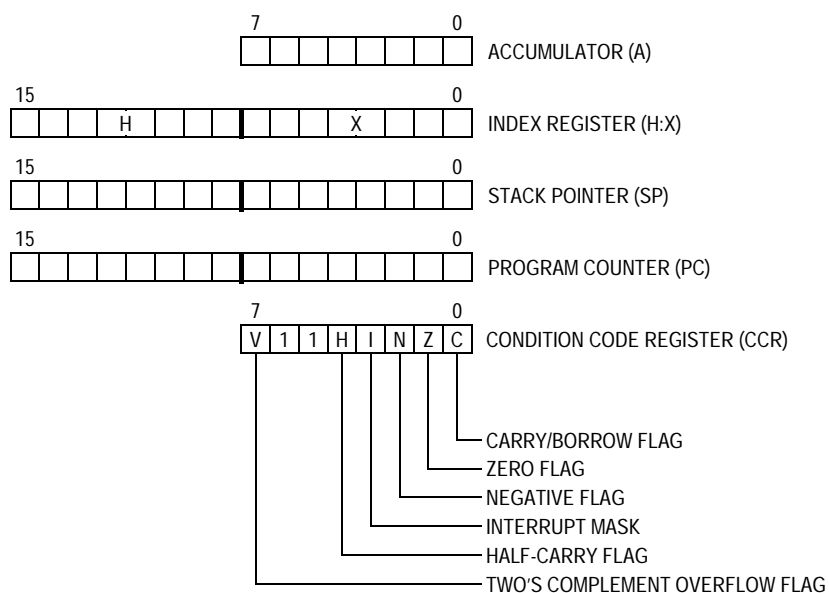

1 = Interrupt request pending

0 = No interrupt request present

## Central Processor Unit (CPU)

**Figure 16** shows the five CPU registers. CPU registers are not part of the memory map.

**Figure 16. CPU Registers**

## Instruction Set Summary

**Table 5** provides a summary of the M68HC08 instruction set.

**Table 5. Instruction Set Summary (Sheet 1 of 7)**

## Oscillator Module (OSC)

The oscillator has these four clock source options available:

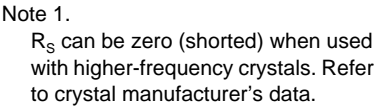

1. Internal oscillator: An internally generated, fixed frequency clock, trimmable to  $\pm 5\%$  in steps of approximately 0.2%. This is the default option out of reset.
2. External oscillator: An external clock that can be driven directly into OSC1.
3. External RC: A built-in oscillator module (RC oscillator) that requires an external R connection only on one pin. The capacitor will be internal to the chip.
4. External crystal: A built-in oscillator module (XTAL oscillator) that requires an external crystal or ceramic-resonator on two pins.

### Internal to External Clock Switching

When external clock source (external OSC, RC, or XTAL) is desired, the user must perform the following steps:

1. For External crystal circuits only, OSCOPT[1:0] = 1:1: To help precharge an external crystal oscillator, set PTA4 (OSC2) as an output and drive high for several cycles. Before writing OSCOPT[1:0], the crystal will see a sharp falling edge at startup.
2. Set CONFIG2 bits OSCOPT[1:0] according to [Table 7](#). The oscillator module control logic will then set OSC1 as an external clock input and, if the external crystal option is selected, OSC2 will also be set as the clock output.
3. Create a software delay to wait the stabilization time needed for the selected clock source (crystal, resonator, RC) as recommended by the component manufacturer. A good rule of thumb for crystal oscillators is to wait 4096 cycles of the crystal frequency, i.e., for a 4-MHz crystal, wait approximately 1 msec.
4. After this delay has elapsed, the ECGON bit in the OSC status register (OSCSTAT) should be set by the user software.
5. After ECGON set is detected, the OSC module checks for oscillator activity by waiting two external clock rising edges.
6. The OSC module then switches to the external clock. Logic provides a glitch free transition.
7. The OSC module sets the ECGST bit in the OSCSTAT register and then stops the internal oscillator.

**NOTE:** Once transition to the external clock is done, the internal oscillator will only be reactivated with reset. Clock does not switch back to internal if external clock stops.

### Figure 17. XTAL Oscillator External Connections

### Figure 18. RC Oscillator External Connections

## Oscillator Status Register

The oscillator status register (OSCSTAT) contains the bits for switching from internal to external clock sources

\$0036	Bit 7	6	5	4	3	2	1	Bit 0
	R	R	R	R	R	R	ECGON	ECGST
Reset:	0	0	0	0	0	0	0	0
	R	= Reserved						

**Figure 19. Oscillator Status Register (OSCSTAT)**

ECGON — External Clock Generator On Bit

1 = External clock generator enabled

ECGST — External Clock Status Bit

1 = An external clock source engaged

## Oscillator Trim Register (OSCTRIM)

\$0038	Bit 7	6	5	4	3	2	1	Bit 0
	TRIM7	TRIM6	TRIM5	TRIM4	TRIM3	TRIM2	TRIM71	TRIM0
Reset:	1	0	0	0	0	0	0	0

**Figure 20. Oscillator Trim Register (OSCTRIM)**

TRIM7–TRIM0 — Internal Oscillator Trim Factor Bits

These read/write bits change the size of the internal capacitor used by the internal oscillator. By testing the frequency of the internal clock and adjusting this factor accordingly, the frequency of the internal clock can be fine tuned. Increasing (decreasing) this factor by one increases (decreases) the period by approximately 0.2% of the untrimmed period (the period for trim = \$80). The trimmed frequency is guaranteed not to vary by more than  $\pm 5\%$  over the full specified range of temperature and voltage. The reset value is \$80 which sets the frequency to 3.2 MHz  $\pm$  25% (bus rate).

A trim adjustment factor can be programmed into FLASH memory at TRIMLOC (\$FFC0). During the application initialization routine, this value can be read from TRIMLOC and be stored to OSCTRIM (\$0038) to fine tune the internal oscillator frequency.

## Timer Interface Module (TIM)

Features of the TIM include the following:

- Two input capture/output compare channels
  - Rising-edge, falling-edge, or any-edge input capture trigger
  - Set, clear, or toggle output compare action
- Buffered and unbuffered pulse width modulation (PWM) signal generation
- Programmable TIM clock input with 7-frequency internal bus clock prescaler selection
- Free-running or modulo up-count operation
- Optional toggle of any channel pin on overflow
- TIM counter stop and reset bits

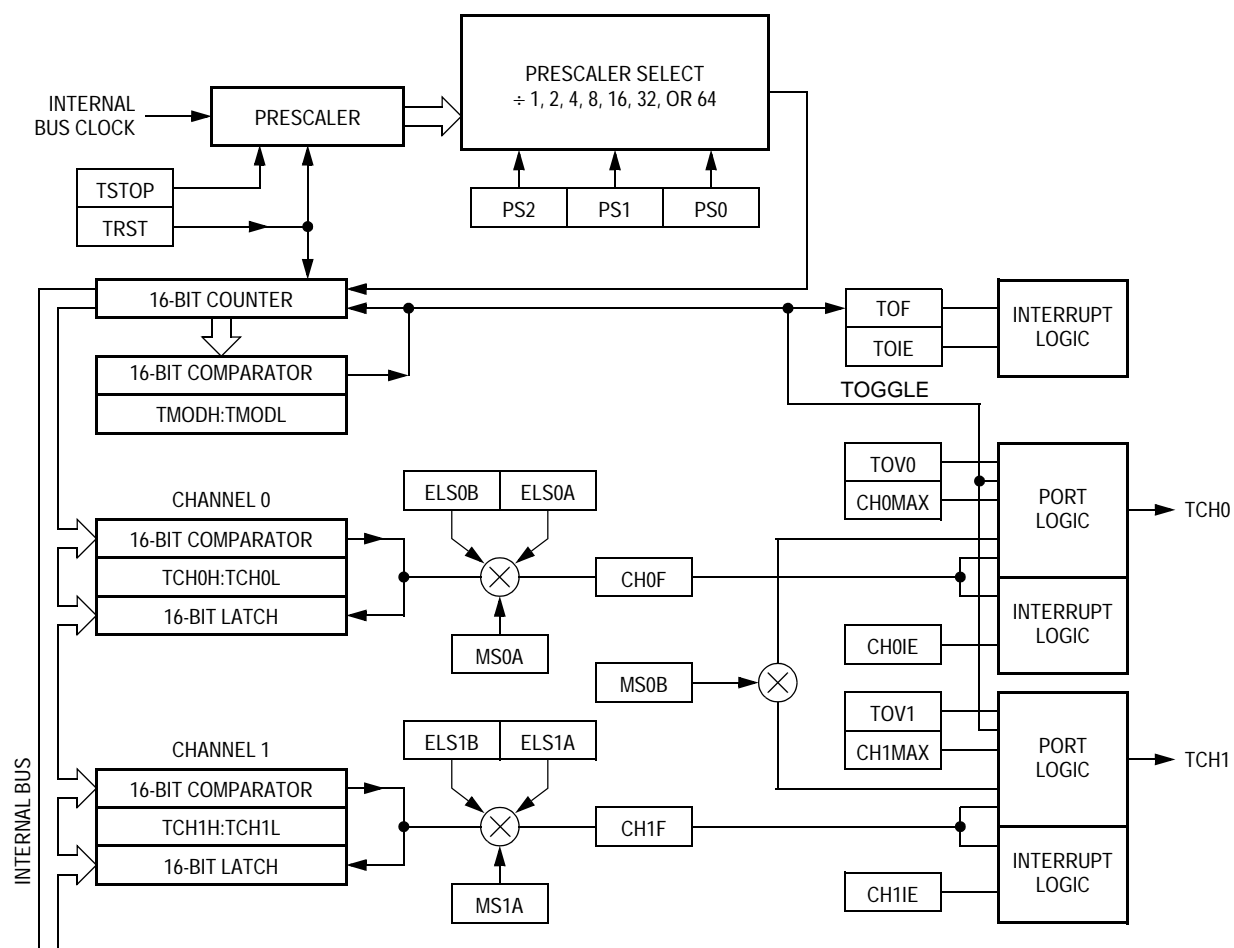

Figure 21. TIM Block Diagram

## PWM Initialization

Recommended initialization procedure for unbuffered or buffered PWM signals.

1. In TSC:
  - a. Stop the TIM counter by setting TSTOP.
  - b. Reset the TIM counter and prescaler by setting TRST.
2. Write TMODH:TMODL to set the required PWM period.
3. Write TCHxH:TCHxL to set the required pulse width.
4. Write TIM channel x status and control register (TSCx) to select the desired function:
  - a. Write 0:1 (for unbuffered output compare or PWM signals) or 1:0 (for buffered output compare or PWM signals) to the mode select bits, MSxB:MSxA. See [Table 7](#).
  - b. Write 1 to the toggle-on-overflow bit, TOVx.
  - c. Write 1:0 (to clear output on compare) or 1:1 (to set output on compare) to the edge/level select bits, ELSxB:ELSxA. The output action on compare must force the output to the complement of the pulse width level. See [Table 7](#).
5. Clear TSTOP in the TIM status control register (TSC).

## TIM Status and Control Register

\$0020	Bit 7	6	5	4	3	2	1	Bit 0
	TOF	TOIE	TSTOP	TRST	0	PS2	PS1	PS0
Reset:	0	0	1	0	0	0	0	0

**Figure 22. TIM Status and Control Register (TSC)**

TOF — TIM Overflow Flag Bit

TOF is set when the TIM counter reaches the modulo value programmed in the TIM counter modulo registers. Clear TOF by reading the TIM status and control register when TOF is set and then writing a logic 0 to TOF.

1 = TIM counter has reached modulo value

TOIE — TIM Overflow Interrupt Enable Bit

1 = TIM overflow interrupts enabled

TSTOP — TIM Stop Bit

1 = TIM counter stopped

TRST — TIM Reset Bit

Setting this write-only bit resets the TIM counter and the TIM prescaler. TRST is cleared automatically after the TIM counter is reset and always reads as logic 0.

1 = Prescaler and TIM counter cleared

**NOTE:** Setting the TSTOP and TRST bits simultaneously stops the TIM counter at a value of \$0000.

## PS[2:0] — Prescaler Select Bits

**Table 6. Prescaler Selection**

PS2	PS1	PS0	TIM Clock Source
0	0	0	Internal bus clock ÷ 1
0	0	1	Internal bus clock ÷ 2
0	1	0	Internal bus clock ÷ 4
0	1	1	Internal bus clock ÷ 8
1	0	0	Internal bus clock ÷ 16
1	0	1	Internal bus clock ÷ 32
1	1	0	Internal bus clock ÷ 64
1	1	1	Reserved

**TIM Counter Registers**

The two read-only TIM counter registers contain the high and low bytes of the value in the TIM counter. Reading the high byte (TCNTH) latches the contents of the low byte (TCNTL) into a buffer. Subsequent reads of TCNTH do not affect the latched TCNTL value until TCNTL is read.

TCNTH \$0021	Bit 7	6	5	4	3	2	1	Bit 0
	Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8
Reset:	0	0	0	0	0	0	0	0
TCNTL \$0022	Bit 7	6	5	4	3	2	1	Bit 0
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reset:	0	0	0	0	0	0	0	0

**Figure 23. TIM Counter Registers (TCNTH:TCNTL)****TIM Counter Modulo Registers**

When the TIM counter reaches the modulo value, the overflow flag (TOF) becomes set, and the TIM counter resumes counting from \$0000 at the next timer clock. Writing to the high byte (TMODH) inhibits the TOF bit and overflow interrupts until the low byte (TMODL) is written.

TMODH \$0023	Bit 7	6	5	4	3	2	1	Bit 0
	Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8
Reset:	1	1	1	1	1	1	1	1
TMODL \$0024	Bit 7	6	5	4	3	2	1	Bit 0
	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Reset:	1	1	1	1	1	1	1	1

**Figure 24. TIM Counter Modulo Registers (TMODH:TMODL)**

## TIM Channel Status and Control Registers

TSC0	\$0025	Bit 7	6	5	4	3	2	1	Bit 0
		CH0F	CH0IE	MS0B	MS0A	ELS0B	ELS0A	TOV0	CH0MAX
Reset:		0	0	0	0	0	0	0	0
TSC1	\$0028	Bit 7	6	5	4	3	2	1	Bit 0
		CH1F	CH1IE	0	MS1A	ELS1B	ELS1A	TOV1	CH1MAX
Reset:		0	0	0	0	0	0	0	0

**Figure 25. TIM Channel Status and Control Registers (TSC0, TSC1)**

### CHxF — Channel x Flag Bit

When channel x is an input capture channel, CHxF is set when an active edge occurs on the channel x pin. When channel x is an output compare channel, CHxF is set when the value in the TIM counter registers matches the value in the TIM channel x registers.

Clear CHxF by reading the TIM channel x status and control register with CHxF set and then writing a logic 0 to CHxF.

1 = Input capture or output compare on channel x

### CHxIE — Channel x Interrupt Enable Bit

1 = Channel x CPU interrupt requests enabled

MSxB, MSxA, ELSxB, and ELSxA

**Table 7. Mode, Edge, and Level Selection**

MSxB	MSxA	ELSxB	ELSxA	Mode	Configuration
X	0	0	0	Output preset	Pin under port control; initial output level high
X	1	0	0		Pin under port control; initial output level low
0	0	0	1	Input capture	Capture on rising edge only
0	0	1	0		Capture on falling edge only
0	0	1	1		Capture on rising or falling edge
0	1	0	1	Output compare or PWM	Toggle output on compare
0	1	1	0		Clear output on compare
0	1	1	1		Set output on compare
1	X	0	1	Buffered output compare or buffered PWM	Toggle output on compare
1	X	1	0		Clear output on compare
1	X	1	1		Set output on compare

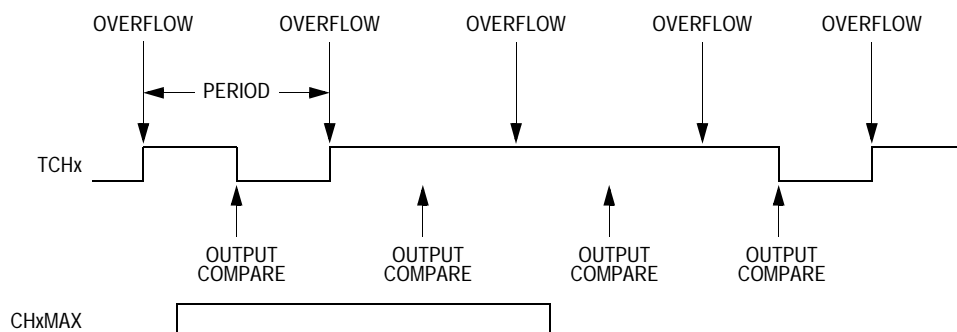

### TOVx — Toggle-On-Overflow Bit

1 = Channel x pin toggles on TIM counter overflow.

**NOTE:** When TOVx is set, a TIM counter overflow takes precedence over a channel x output compare if both occur at the same time.

**CHxMAX — Channel x Maximum Duty Cycle Bit**

When the TOVx bit is at logic 1, setting the CHxMAX bit forces the duty cycle of buffered and unbuffered PWM signals to 100%. The CHxMAX bit takes effect in the cycle after it is set or cleared. The output stays at the 100% duty cycle level until the cycle after CHxMAX is cleared.

**Figure 26. CHxMAX Latency****TIM Channel Registers**

In input capture mode ( $MSxB:MSxA = 0:0$ ), reading the high byte of the TIM channel x registers (TCHxH) inhibits input captures until the low byte (TCHxL) is read.

In output compare mode ( $MSxB:MSxA \neq 0:0$ ), writing to the high byte of the TIM channel x registers (TCHxH) inhibits output compares until the low byte (TCHxL) is written.

TCH0H \$0026	Bit 7	6	5	4	3	2	1	Bit 0
	Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8

Reset:	Indeterminate after reset							

**Figure 27. TIM Channel Registers (TCH0H:L, TCH1H:L)**

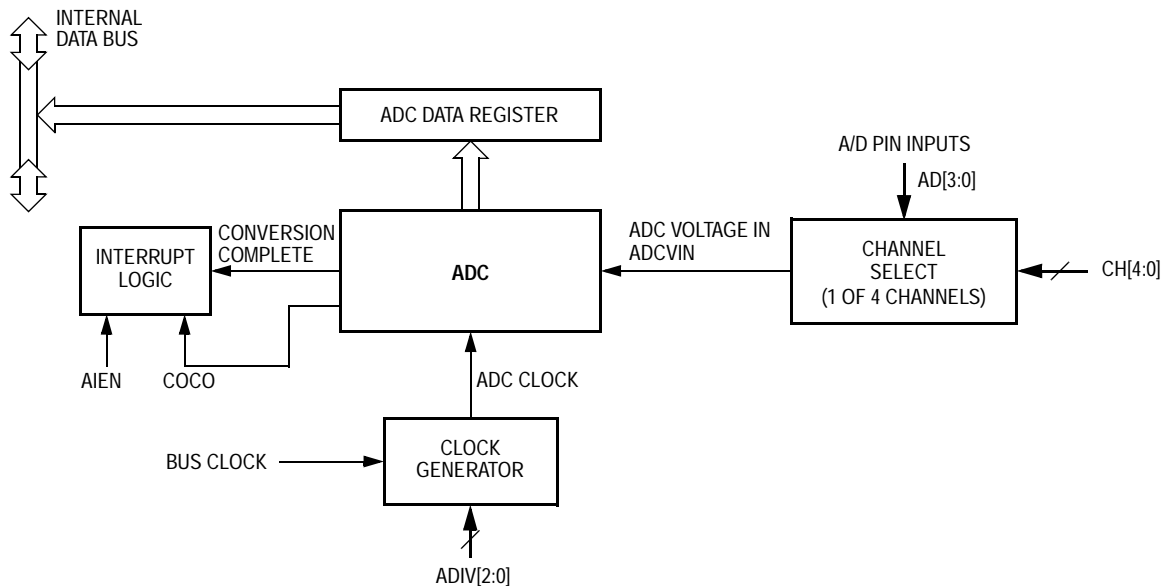

## Analog-to-Digital Converter (ADC)

The ADC is an 8-bit, 4-channel analog-to-digital converter. The ADC module is only available on the MC68HC908QY2, MC68HC908QT2, MC68HC908QY4, and MC68HC908QT4.

Features of the ADC module include:

- 4 channels with multiplexed input
- Linear successive approximation with monotonicity
- 8-bit resolution
- Single or continuous conversion
- Conversion complete flag or conversion complete interrupt
- Selectable ADC clock

**Figure 28. ADC Block Diagram**

### Conversion Time

$$\text{Conversion Time} = \frac{16 \text{ ADC Clock Cycles}}{\text{ADC Clock Frequency}}$$

$$\text{Number of Bus Cycles} = \text{Conversion Time} \times \text{Bus Frequency}$$

## ADC Status and Control Register

\$003C	Bit 7	6	5	4	3	2	1	Bit 0
	COCO	AIEN	ADCO	CH4	CH3	CH2	CH1	CH0
Reset:	0	0	0	1	1	1	1	1

**Figure 29. ADC Status and Control Register (ADSCR)**

**COCO** — Conversions Complete Bit

When the AIEN bit is a logic 0, the COCO is a read-only bit which is set each time a conversion is completed. This bit is cleared whenever ADSCR is written or whenever the ADR is read.

When the AIEN bit is a logic 1 (CPU interrupt enabled), COCO will always be logic 0 when read.

1 = Conversion completed (AIEN = 0)

**AIEN** — ADC Interrupt Enable Bit

1 = ADC interrupt enabled

**ADCO** — ADC Continuous Conversion Bit

1 = Continuous ADC conversion

0 = Single ADC conversion

**CH[4:0]** — ADC Channel Select Bits

**NOTE:** Startup from the ADC power off state requires one conversion cycle to stabilize.

**Table 8. MUX Channel Select**

CH4	CH3	CH2	CH1	CH0	ADC Channel	Input Select
0	0	0	0	0	AD0	PTA0
0	0	0	0	1	AD1	PTA1
0	0	0	1	0	AD2	PTA4
0	0	0	1	1	AD3	PTA5
0 ↓ 1	0 ↓ 1	1 ↓ 0	0 ↓ 1	0 ↓ 0	— — —	Unused <sup>(1)</sup>
1	1	0	1	1	—	Reserved
1	1	1	0	0	—	Unused
1	1	1	0	1	—	V <sub>DDA</sub> <sup>(2)</sup>
1	1	1	1	0	—	V <sub>SSA</sub> <sup>(2)</sup>
1	1	1	1	1	—	ADC power off

1. If any unused channels are selected, the resulting ADC conversion will be unknown.

2. The voltage levels supplied from internal reference nodes, as specified in the table, are used to verify the operation of the ADC converter both in production test and for user applications.

## ADC Data Register

This register is updated each time an ADC conversion completes.

\$003E	Bit 7	6	5	4	3	2	1	Bit 0
	AD7	AD6	AD5	AD4	AD3	AD2	AD1	AD0

0	1	0	Bus clock ÷ 4
0	1	1	Bus clock ÷ 8
1	X	X	Bus clock ÷ 16

X = don't care

## Input/Output (I/O) Ports

### Port A

Port A is an 6-bit special function port that shares all six of its pins with the keyboard interrupt (KBI) module. Each port A pin also has a software configurable pullup device if the corresponding port pin is configured as a general-purpose input port, a KBI input, or the IRQ input. PTA3 has a fixed pullup device when configured as  $\overline{RST}$ .

**NOTE:** PTA2 is input only.

### Port A Data Register

\$0000	Bit 7	6	5	4	3	2	1	Bit 0
	R	AWUL	PTA5	PTA4	PTA3	PTA2	PTA1	PTA0
Reset:	Unaffected by reset							
Additional Functions:			KBI5 AD3 OSC1	KBI4 AD2 OSC2	KBI3 $\overline{RST}$	KBI2 $\overline{IRQ}$	KBI1 AD1 TCH1	KBI0 AD0 TCH0
	R	= Reserved						

**Figure 32. Port A Data Register (PTA)**

**PTA[5:0] — Port A Data Bits**

These read/write bits are software programmable. Data direction of each port A pin is under the control of the corresponding bit in data direction register A (PTA2 is input only). Reset has no effect on port A data.

**AWUL — Auto Wakeup Latch Data Bit**

This is a read-only bit which has the value of the auto wakeup interrupt request latch. The wakeup request signal is generated internally.

**Data Direction Register A**

\$0004	Bit 7	6	5	4	3	2	1	Bit 0
	R	R	DDRA5	DDRA4	DDRA3	0	DDRA1	DDRA0
Reset:	0	0	0	0	0	0	0	0
	R	= Reserved						

**Figure 33. Data Direction Register A (DDRA)****DDRA[5:0] — Data Direction Register A Bits**

**Figure 37. Port B Input Pullup Enable Register (PTBPUE)**

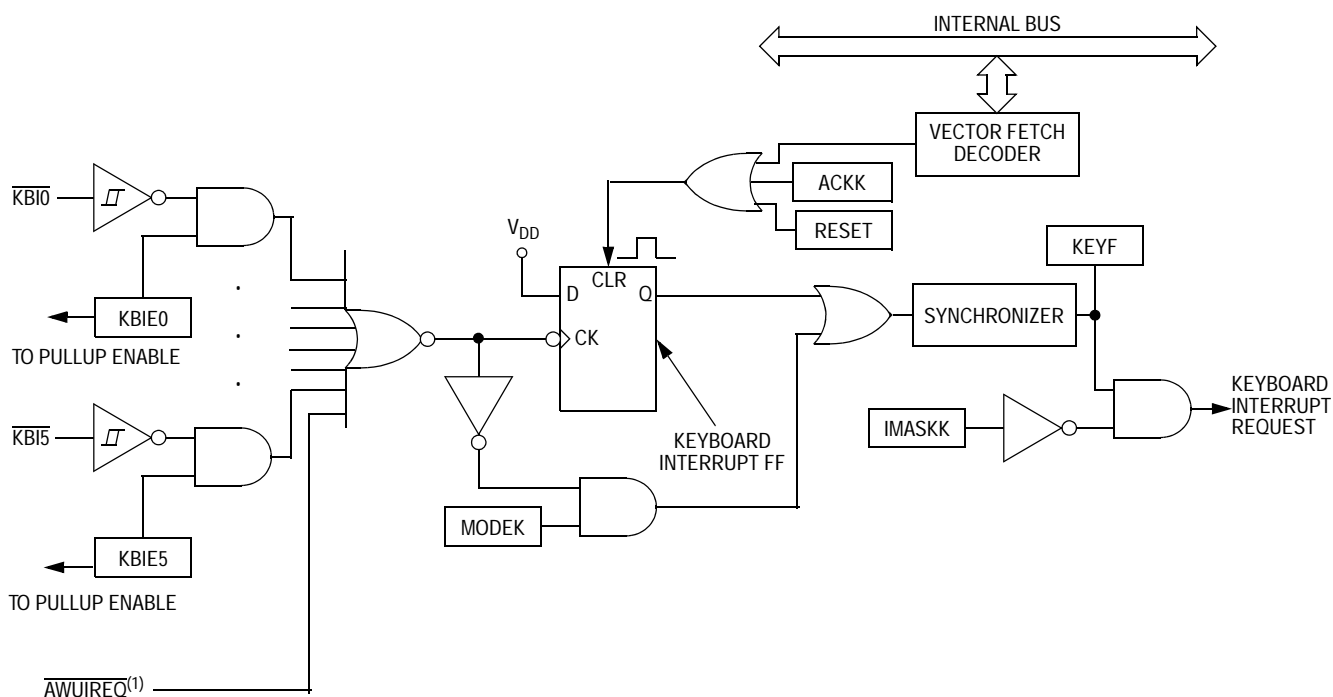

### PTBPUE[7:0] — Port B Input Pullup Enable Bits

- These read/write bits are software programmable to enable pullup devices on port B pins
- 1 = Corresponding port B pin configured to have internal pull if its DDRB bit is set to 0

## Keyboard Interrupt Module (KBI)

Features of the keyboard interrupt module include:

- Six keyboard interrupt pins with separate keyboard interrupt enable bits and one keyboard interrupt mask
- Pullup device if input pin is configured as a keyboard interrupt input
- Programmable edge-only or edge and level interrupt sensitivity
- Exit from low-power modes

1. For AWUGEN logic refer to [Figure 41](#).

**Figure 38. Keyboard Interrupt Block Diagram**

## Keyboard Status and Control Register

\$001A	Bit 7	6	5	4	3	2	1	Bit 0
	0	0	0	0	KEYF	ACKK	IMASKK	MODEK
Reset:	0	0	0	0	0	0	0	0

**Figure 39. Keyboard Status and Control Register (KBSCR)**

KEYF — Keyboard Flag Bit

1 = Keyboard interrupt pending

ACKK — Keyboard Acknowledge Bit

Writing a logic 1 to this write-only bit clears the keyboard interrupt request on port A and auto wakeup logic. ACKK always reads as logic 0.

IMASKK — Keyboard Interrupt Mask Bit

1 = Keyboard interrupt requests masked (disabled)

MODEK — Keyboard Triggering Sensitivity Bit

1 = Keyboard interrupt requests on falling edges and low levels

0 = Keyboard interrupt requests on falling edges only

## Keyboard Interrupt Enable Register

\$001B	Bit 7	6	5	4	3	2	1	Bit 0
Read:	0	AWUIE	KBIE5	KBIE4	KBIE3	KBIE2	KBIE1	KBIE0

**Figure 40. Keyboard Interrupt Enable Register (KBIER)**

KBIE5–KBIE0 — Port A Keyboard Interrupt Enable Bits

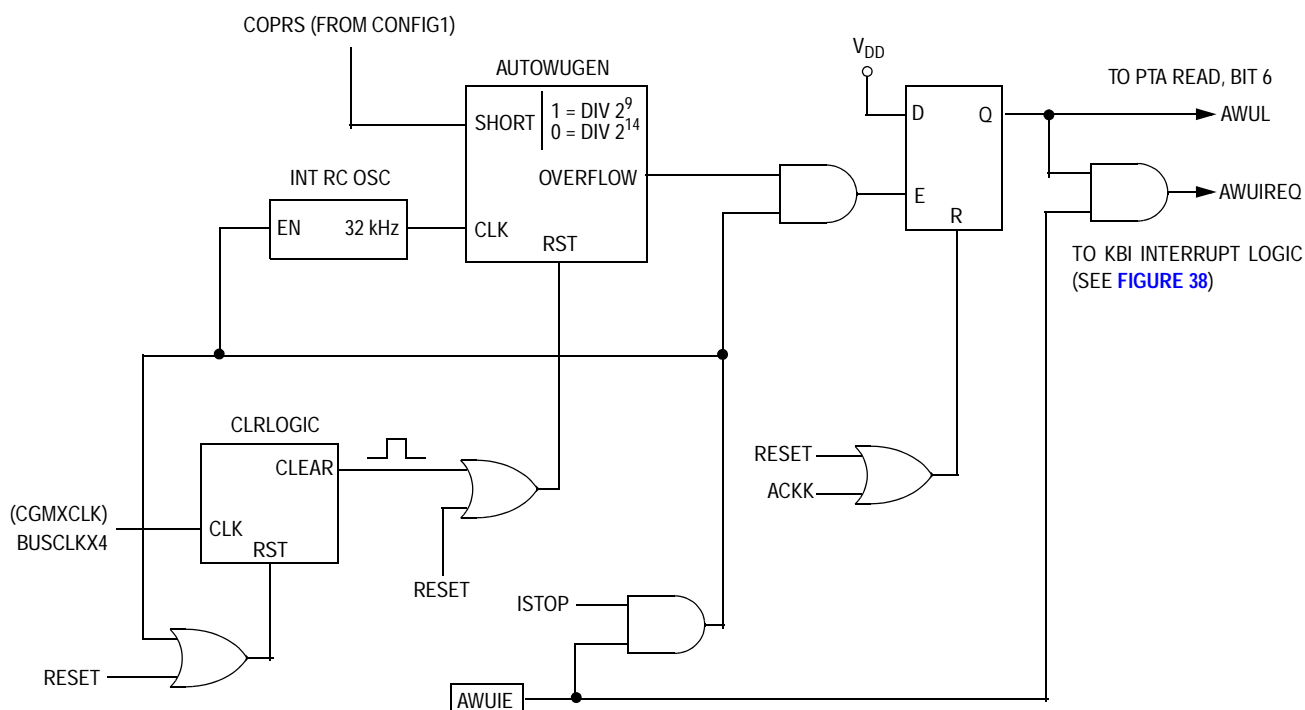

1 = KBIx pin enabled as keyboard interrupt pin

**NOTE:** *AWUIE bit is not used in conjunction with the keyboard interrupt feature. To see a description of this bit, see [Auto Wakeup Module \(AWU\)](#).*

## Auto Wakeup Module (AWU)

Features of the auto wakeup module include:

- One internal interrupt with separate interrupt enable bit, sharing the same keyboard interrupt vector and keyboard interrupt mask bit.
- Exit from low-power stop mode without external signals.
- Selectable timeout periods of 16 milliseconds or 512 milliseconds.
- Dedicated low power internal oscillator separate from the main system clock sources.

**Figure 41. Auto Wakeup Interrupt Request Generation Logic**

**NOTE:** The typical values of the periodic wake-up request are (at room temperature):

- $COPRS = 0$ : 650 ms @ 5 V, 950 ms @ 3 V
- $COPRS = 1$ : 16 ms @ 5 V, 23 ms @ 3 V

## Input/Output Registers

The AWU shares registers with the keyboard interrupt (KBI) module and the port A I/O module. The following I/O registers control and monitor operation of the AWU:

- Port A data register (PTA)
- Keyboard interrupt status and control register (KBSCR)
- Keyboard interrupt enable register (KBIER)

### Port A Data Register

Address: \$0000

\$0000	Bit 7	6	5	4	3	2	1	Bit 0
	0	AWUL	PTA5	PTA4	PTA3	PTA2	PTA1	PTA0
Reset:	0	0	Unaffected by reset					

**Figure 42. Port A Data Register (PTA)**

### AWUL — Auto Wake-Up Latch

This is a read-only bit which has the value of the auto wake-up interrupt request latch. The wake-up request signal is generated internally. There is no PTA6 port or any of the associated bits such as PTA6 data direction or pullup bits.

1 = Auto wake-up interrupt request is pending

**NOTE:** PTA5–PTA0 bits are not used in conjunction with the auto wake-up feature. To see a description of these bits, see [Port A Data Register](#).

### Keyboard Status and Control Register

\$001A	Bit 7	6	5	4	3	2	1	Bit 0
	0	0	0	0	KEYF	ACKK	IMASKK	MODEK
Reset:	0	0	0	0	0	0	0	0

**Figure 43. Keyboard Status and Control Register (KBSCR)**

### KEYF — Keyboard Flag Bit

1 = Keyboard interrupt pending

### ACKK — Keyboard Acknowledge Bit

Writing a logic 1 to this write-only bit clears the keyboard interrupt request on port A and auto wakeup logic. ACKK always reads as logic 0.

### IMASKK — Keyboard Interrupt Mask Bit

1 = Keyboard interrupt requests masked (disabled)

**NOTE:** MODEK is not used in conjunction with the auto wake-up feature. To see a description of this bit, see [Keyboard Interrupt Module \(KBI\)](#).

### Keyboard Interrupt Enable Register

\$001B	Bit 7	6	5	4	3	2	1	Bit 0
Read:	0	AWUIE	KBIE5	KBIE4	KBIE3	KBIE2	KBIE1	KBIE0
Reset:	0	0	0	0	0	0	0	0

**Figure 44. Keyboard Interrupt Enable Register (KBIER)**

### AWUIE — Auto Wakeup Interrupt Enable Bit

This read/write bit enables the auto wake-up interrupt input to latch interrupt requests. Reset clears AWUIE.

1 = Auto wakeup enabled as interrupt input

**NOTE:** KBIE5–KBIE0 bits are not used in conjunction with the auto wake-up feature. To see a description of these bits, see [Keyboard Interrupt Module \(KBI\)](#).

## Break Module

This section describes the breakpoint module which works in conjunction with third-party development software to allow development of debugging of application systems.

### Break Status and Control Register

\$FE0B	Bit 7	6	5	4	3	2	1	Bit 0
	BRKE	BRKA	0	0	0	0	0	0
Reset:	0	0	0	0	0	0	0	0

**Figure 45. Break Status and Control Register (BRKSCR)**

#### BRKE — Break Enable Bit

This read/write bit enables breaks on break address register matches.

1 = Breaks enabled on 16-bit address match

0 = Breaks disabled

#### BRKA — Break Active Bit

This read/write status and control bit is set when a break address match occurs. Writing a logic 1 to BRKA generates a break interrupt. Clear BRKA by writing a logic 0 to it before exiting the break routine.

1 = Break address match

### Break Address Registers

The break address registers (BRKH and BRKL) contain the high and low bytes of the desired breakpoint address.

\$FE09	Bit 7	6	5	4	3	2	1	Bit 0
	Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8

**Figure 47. Break Address Register Low (BRKL)**

## Break Auxiliary Register

The break auxiliary register (BRKAR) contains a bit that enables software to disable the COP while the MCU is in a state of break interrupt with monitor mode.

\$FE02	Bit 7	6	5	4	3	2	1	Bit 0
	0	0	0	0	0	0	0	BDCOP
Reset:	0	0	0	0	0	0	0	0

**Figure 48. Break Auxiliary Register (BRKAR)**

BDCOP — Break Disable COP Bit

1 = COP disabled during break interrupt

## Break Flag Control Register

The break control register (BFCR) contains a bit that enables software to clear status bits while the MCU is in a break state.

\$FE03	Bit 7	6	5	4	3	2	1	Bit 0
	BCFE	R	R	R	R	R	R	R
Reset:	0							
	R	= Reserved						

**Figure 49. Break Flag Control Register (BFCR)**

BCFE — Break Clear Flag Enable Bit

This read/write bit enables software to clear status bits by accessing status registers while the MCU is in a break state. To clear status bits during the break state, the BCFE bit must be set.

1 = Status bits clearable during break

0 = Status bits not clearable during break

## Break Status Register

The break status register (BSR) is reserved for use in supporting third party emulation systems.

\$FE00	Bit 7	6	5	4	3	2	1	Bit 0
	R	R	R	R	R	R	SBSW	R
Reset:							0	
	R	= Reserved						

**Figure 50. Break Status Register (BSR)**

## Condensed Electrical Characteristics

For more detailed information refer to the *MC68HC908QY4 Data Sheet* (Motorola document order number MC68HC908QY4/D).

### 5-Volt DC Electrical Characteristics

Characteristic <sup>(1)</sup>	Symbol	Min	Typ <sup>(2)</sup>	Max	Unit
V <sub>DD</sub> supply current Run, f <sub>OP</sub> = 4 MHz <sup>(3)</sup> Wait <sup>(4)</sup> Stop <sup>(5)</sup> , -40°C to 85°C	I <sub>DD</sub>	— — —	7 5 1	10 5.5 5	mA mA μA
POR rearm voltage <sup>(6)</sup>	V <sub>POR</sub>	0	—	100	mV
POR rise time ramp rate <sup>(7)</sup>	R <sub>POR</sub>	0.035	—	—	V/ms
Monitor mode entry voltage	V <sub>DD</sub> +V <sub>HI</sub>	V <sub>DD</sub> + 2.5	—	9.1	V
Pullup resistors <sup>(8)</sup> R <sub>ST</sub> , IR <sub>Q</sub> , PTA0–PTA5, PTB0–PTB7	R <sub>PU</sub>	16	26	36	kΩ
Low-voltage inhibit reset, trip falling voltage	V <sub>TRIPF</sub>	3.90	4.20	4.50	V
Low-voltage inhibit reset, trip rising voltage	V <sub>TRIPR</sub>	4.00	4.30	4.60	V
Low-voltage inhibit reset/recover hysteresis	V <sub>HYS</sub>	—	100	—	mV

1. V<sub>DD</sub> = 4.5 to 5.5 Vdc, V<sub>SS</sub> = 0 Vdc, T<sub>A</sub> = T<sub>L</sub> to T<sub>H</sub>, unless otherwise noted.
2. Typical values reflect average measurements at midpoint of voltage range, 25°C only.
3. Run (operating) I<sub>DD</sub> measured using external square wave clock source. All inputs 0.2 V from rail. No dc loads. Less than 100 pF on all outputs. All ports configured as inputs. Measured with all modules enabled.
4. Wait I<sub>DD</sub> measured using external square wave clock source (f<sub>OP</sub> = 4 MHz); all inputs 0.2 V from rail; no dc loads; less than 100 pF on all outputs. All ports configured as inputs.
5. All ports configured as inputs. All ports driven 0.2 V or less from rail. No dc loads. On the 8-pin versions, port B is configured as inputs with pullups enabled.
6. Maximum is highest voltage that POR is guaranteed.
7. If minimum V<sub>DD</sub> is not reached before the internal POR reset is released,  $\overline{\text{RST}}$  must be driven low externally until minimum V<sub>DD</sub> is reached.
8. R<sub>PU1</sub> and R<sub>PU2</sub> are measured at V<sub>DD</sub> = 5.0 V.

### 5-Volt Control Timing

Characteristic <sup>(1)</sup>	Symbol	Min	Max	Unit
Internal operating frequency <sup>(2)</sup>	f <sub>OP</sub>	—	8	MHz
$\overline{\text{RST}}$ input pulse width low <sup>(3)</sup>	t <sub>IRL</sub>	750	—	ns

1. V<sub>DD</sub> = 4.5 to 5.5 Vdc, V<sub>SS</sub> = 0 Vdc, T<sub>A</sub> = T<sub>L</sub> to T<sub>H</sub>; timing shown with respect to 20% V<sub>DD</sub> and 70% V<sub>SS</sub>, unless otherwise noted.
2. Some modules may require a minimum frequency greater than dc for proper operation; see appropriate table for this information.
3. Minimum pulse width reset is guaranteed to be recognized. It is possible for a smaller pulse width to cause a reset.

## 5-Volt Oscillator Characteristics

Characteristic	Symbol	Min	Typ	Max	Unit
Internal oscillator frequency	$f_{INTCLK}$	—	12.8	—	MHz
Crystal frequency, XTALCLK	$f_{OSCXCLK}$	8	—	16	MHz
RC oscillator frequency, RCCLK	$f_{RCCLK}$	2	—	12	MHz
External clock reference frequency <sup>(1)</sup>	$f_{OSCXCLK}$	dc	—	16	MHz

1. No more than 10% duty cycle deviation from 50%.

**Figure 51. RC versus Frequency (5 Volts @ 25°C)**

### 3-Volt DC Electrical Characteristics

Characteristic <sup>(1)</sup>	Symbol	Min	Typ <sup>(2)</sup>	Max	Unit
V <sub>DD</sub> supply current Run, f <sub>OP</sub> = 2 MHz <sup>(3)</sup> Wait, f <sub>OP</sub> = 2 MHz <sup>(4)</sup> Stop <sup>(5)</sup> , -40°C to 85°C	I <sub>DD</sub>	— — —	5 1 1	8 2.5 5	mA mA μA
POR rearm voltage <sup>(6)</sup>	V <sub>POR</sub>	0	—	100	mV
POR rise time ramp rate <sup>(7)</sup>	R <sub>POR</sub>	0.035	—	—	V/ms
Monitor mode entry voltage	V <sub>DD</sub> +V <sub>HI</sub>	V <sub>DD</sub> + 2.5	—	V <sub>DD</sub> + 4.0	V
Pullup resistors <sup>(8)</sup> RST, IRQ, PTA0–PTA5, PTB0–PTB7	R <sub>PU</sub>	16	26	36	kΩ
Low-voltage inhibit reset, trip falling voltage	V <sub>TRIPF</sub>	2.40	2.55	2.70	V
Low-voltage inhibit reset, trip rising voltage	V <sub>TRIPR</sub>	2.50	2.65	2.80	V
Low-voltage inhibit reset/recover hysteresis	V <sub>HYS</sub>	—	60	—	mV

1. V<sub>DD</sub> = 2.7 to 3.3 Vdc, V<sub>SS</sub> = 0 Vdc, T<sub>A</sub> = T<sub>L</sub> to T<sub>H</sub>, unless otherwise noted.
2. Typical values reflect average measurements at midpoint of voltage range, 25°C only.
3. Run (operating) I<sub>DD</sub> measured using external square wave clock source. All inputs 0.2 V from rail. No dc loads. Less than 100 pF on all outputs. C<sub>L</sub> = 20 pF on OSC2. All ports configured as inputs. OSC2 capacitance linearly affects run I<sub>DD</sub>. Measured with all modules enabled.
4. Wait I<sub>DD</sub> measured using external square wave clock source (f<sub>OP</sub> = 4 MHz); all inputs 0.2 V from rail; no dc loads; less than 100 pF on all outputs. C<sub>L</sub> = 20 pF on OSC2; all ports configured as inputs; OSC2 capacitance linearly affects wait I<sub>DD</sub>.
5. All ports configured as inputs. All ports driven 0.2 V or less from rail. No dc loads. On the 8-pin versions, port B is configured as inputs with pullups enabled.
6. Maximum is highest voltage that POR is guaranteed.
7. If minimum V<sub>DD</sub> is not reached before the internal POR reset is released,  $\overline{\text{RST}}$  must be driven low externally until minimum V<sub>DD</sub> is reached.
8. R<sub>PU1</sub> and R<sub>PU2</sub> are measured at V<sub>DD</sub> = 5.0 V

### 3-Volt Control Timing

Characteristic <sup>(1)</sup>	Symbol	Min	Max	Unit
Internal operating frequency <sup>(2)</sup>	f <sub>OP</sub>	—	4	MHz
$\overline{\text{RST}}$ input pulse width low <sup>(3)</sup>	t <sub>IRL</sub>	1.5	—	μs

1. V<sub>DD</sub> = 2.7 to 3.3 Vdc, V<sub>SS</sub> = 0 Vdc, T<sub>A</sub> = T<sub>L</sub> to T<sub>H</sub>; timing shown with respect to 20% V<sub>DD</sub> and 70% V<sub>DD</sub>, unless otherwise noted.
2. Some modules may require a minimum frequency greater than dc for proper operation; see appropriate table for this information.
3. Minimum pulse width reset is guaranteed to be recognized. It is possible for a smaller pulse width to cause a reset.

### 3-Volt Oscillator Characteristics

Characteristic	Symbol	Min	Typ	Max	Unit
Internal oscillator frequency	$f_{INTCLK}$	—	12.8	—	MHz
Crystal frequency, XTALCLK	$f_{OSCXCLK}$	1	—	16	MHz
RC oscillator frequency, RCCLK	$f_{RCCLK}$	2	—	12	MHz
External clock reference frequency <sup>(1)</sup>	$f_{OSCXCLK}$	dc	—	16	MHz

1. No more than 10% duty cycle deviation from 50%

Figure 52. RC versus Frequency (3 Volts @ 25°C)

### Typical Supply Currents

Figure 53. Typical Operating  $I_{DD}$ , with All Modules Turned On (25°C)

Figure 54. Typical Wait Mode  $I_{DD}$ , with ADC Turned On (25°C)

### Analog-to-Digital Converter Characteristics

Characteristic	Symbol	Min	Max	Unit	Comments
Supply voltage	$V_{DDAD}$	2.7 ( $V_{DD}$ min.)	5.5 ( $V_{DD}$ max.)	V	—
Input voltages	$V_{ADIN}$	$V_{SS}$	$V_{DD}$	V	—
Resolution	$B_{AD}$	8	8	Bits	—
Absolute accuracy	$A_{AD}$	$\pm 0.5$	$\pm 1.5$	LSB	Includes quantization
ADC internal clock	$f_{ADIC}$	0.5	1.048	MHz	$t_{ADIC} = 1/f_{ADIC}$ , tested only at 1 MHz
Conversion range	$R_{AD}$	$V_{SS}$	$V_{DD}$	V	—
Power-up time	$t_{ADPU}$	16	—	$t_{ADIC}$ cycles	$t_{ADIC} = 1/f_{ADIC}$
Conversion time	$t_{ADC}$	16	17	$t_{ADIC}$ cycles	$t_{ADIC} = 1/f_{ADIC}$
Sample time <sup>(1)</sup>	$t_{ADS}$	5	—	$t_{ADIC}$ cycles	$t_{ADIC} = 1/f_{ADIC}$
Zero input reading <sup>(2)</sup>	$Z_{ADI}$	00	01	Hex	$V_{IN} = V_{SS}$
Full-scale reading <sup>(3)</sup>	$F_{ADI}$	FE	FF	Hex	$V_{IN} = V_{DD}$
Input capacitance	$C_{ADI}$	—	8	pF	Not tested
Input leakage <sup>(3)</sup>	—	—	$\pm 1$	$\mu A$	—

1. Source impedances greater than 10 k $\Omega$  may adversely affect internal RC charging time during input sampling.

2. Zero-input/full-scale reading requires sufficient decoupling measures for accurate conversions.

3. The external system error caused by input leakage current is approximately equal to the product of R source and input current.

## Memory Characteristics

Characteristic	Symbol	Min	Max	Unit
RAM data retention voltage	$V_{RDR}$	1.3	—	V
FLASH program bus clock frequency	—	1	—	MHz
FLASH read bus clock frequency	$f_{Read}^{(1)}$	0	8M	Hz
FLASH page erase time <1 K cycles <10 K cycles	$t_{Erase}^{(2)}$	1 4	— —	ms
FLASH mass erase time	$t_{MErase}^{(3)}$	4	—	ms
FLASH PGM/ERASE to HVEN set up time	$t_{NVS}$	10	—	$\mu$ s
FLASH high-voltage hold time	$t_{NVH}$	5	—	$\mu$ s
FLASH high-voltage hold time (mass erase)	$t_{NVHL}$	100	—	$\mu$ s
FLASH program hold time	$t_{PGS}$	5	—	$\mu$ s
FLASH program time	$t_{PROG}$	30	40	$\mu$ s
FLASH return to read time	$t_{RCV}^{(4)}$	1	—	$\mu$ s
FLASH cumulative program hv period	$t_{HV}^{(5)}$	—	4	ms
FLASH row erase endurance <sup>(6)</sup>	—	10 k	—	Cycles
FLASH row program endurance <sup>(7)</sup>	—	10 k	—	Cycles
FLASH data retention time <sup>(8)</sup>	—	10	—	Years

- $f_{Read}$  is defined as the frequency range for which the FLASH memory can be read.
- If the page erase time is longer than  $t_{Erase}$  (Min), there is no erase disturb, but it reduces the endurance of the FLASH memory.
- If the mass erase time is longer than  $t_{MErase}$  (Min), there is no erase disturb, but it reduces the endurance of the FLASH memory.
- $t_{RCV}$  is defined as the time it needs before the FLASH can be read after turning off the high voltage charge pump, by clearing HVEN to logic 0.
- $t_{HV}$  is defined as the cumulative high voltage programming time to the same row before next erase.  
 $t_{HV}$  must satisfy this condition:  $t_{NVS} + t_{NVH} + t_{PGS} + (t_{PROG} \times 32) \leq t_{HV}$  maximum.
- The minimum row endurance value specifies each row of the FLASH memory is guaranteed to work for at least this many erase/program cycles.
- The minimum row endurance value specifies each row of the FLASH memory is guaranteed to work for at least this many erase/program cycles.
- The FLASH is guaranteed to retain data over the entire operating temperature range for at least the minimum time specified.

## Revision History

Date	Revision Level	Description	Page Number(s)
September, 2002	N/A	Initial release	N/A
December, 2002	1.0	<b>Table 1. MC Order Numbers</b> — Added ordering information for 8-pin dual flat no lead (DFN) package.	1
		<b>Features</b> — Added 8-pin DFN package.	3
		<b>Figure 2. MCU Pin Assignments</b> — Figure updated to include DFN packages.	5
		<b>Figure 3. Memory Map</b> — Clarified illegal address and unimplemented memory.	7
		<b>Figure 4. Control, Status, and Data Registers</b> — Corrected bit definitions for Port A Data Register (PTA) and Data Direction Register A (DDRA).	8
		<b>SIM Reset Status Register</b> — Clarified description of ILAD bit.	16
		<b>Figure 32. Port A Data Register (PTA)</b> — Corrected bit definition for PTA7.	35
		<b>Figure 33. Data Direction Register A (DDRA)</b> — Corrected bit definitions for DDRA7 and DDRA6.	36
		<b>Keyboard Interrupt Module (KBI)</b> — Section reworked to remove reference to auto wakeup module.	38
		<b>Auto Wakeup Module (AWU)</b> — Added description of AWU module.	39
		<b>Condensed Electrical Characteristics</b> — Section updated.	44
